

AMENDMENTS TO THE SPECIFICATION

Please replace the paragraph beginning on page 3, line 25 of the Specification with the following amended paragraph:

--For example, the combination of the evaporators 10 and the air movers 12 shown in Fig. 1 may be used with marine containers 80 (~~not shown in Fig. 2~~) which are typically used to transport fresh produce. However, fresh produce gives off a significant amount of heat while ripening and, therefore, during transit it is desirable to control the rate of ripening. As a result of the evaporators' 10 extraction of heat and humidity from the airflow through the housings 20, the downwardly directed airflow then permits cooler and dryer air to contact the fresh produce to prolong or stabilize the rate of ripening. In the event produce ~~in~~is to be transported through extremely cold climates, the heater 18 may instead be operated to warm the airflow through the air mover 12 so that warmer temperatures may be maintained. Thus, the heater 18 is preferably only operated when refrigeration is not needed.--.
